Project Title: School Management System

Date:20.Oct.2026

Prepared by:

First Student:202510531

Second Student:202510547

- Business Idea:

The School Management System is designed to help schools manage student records, teacher information, courses, and student enrollments in an organized way.

- Project Scope:

The system will manage student information, teacher details, course information, and student enrollment records. The project focuses on designing a UML Class Diagram rather than developing a complete software application.

## ➢ Problem Statement:

Many schools manage student and teacher information manually using paper records and spreadsheets. This can lead to errors, duplicated information, and difficulties in updating and retrieving records. Therefore, a School Management System is needed to organize school information and improve the efficiency of school administration.

## ➢ Purpose of the Proposed System:

The purpose of the proposed School Management System is to organize school information, improve data accuracy, reduce paperwork, and make it easier to manage student records, teacher information, courses, and enrollment records.

## ➢ Main Classes and Responsibilities

The School Management System consists of four main classes:

1. Student: Stores student information, including student ID, full name, and email address.

2. Teacher: Stores teacher information, including teacher ID, full name, and specialization.

3. Course: Stores course information, including course ID, course name, and credits.

4. Enrollment: Records student enrollment in courses, including enrollment date and enrollment status.

## ➢ System Requirements

The School Management System should be able to:

1. Store and retrieve student information.
2. Store and update teacher information.
3. Create and manage course records.
4. Assign teachers to courses.

5. Register students in courses.
6. Record enrollment dates and statuses.
